

Filipinohomes deep research (2026-10-06)

Source: `/deep-research run wf_32ec61ab-571` . 22 sources fetched, 93 claims extracted, 25 verified (3-vote adversarial), 12 confirmed, 13 killed, 68 never verified (budget cut).

Read this first: only the CONFIRMED section is safe to build on. UNVERIFIED is a lead list, not fact. REFUTED claims must not appear in any doc, pitch or price sheet.

Summary

Filipinohomes (filipinohomes.com) is confirmed as a Cebu-based real-estate brand led by founder and CEO Anthony Gerard Leuterio, active as of July 2026. It presents as a hybrid: a nationwide network of property specialists (brokerage style) that also runs listings and agent-directory pages. The strongest product hook found is its own public "Inquiry Reply" metric. Even the fastest agents reply in about 10 to 48 minutes, and the list falls to hours further down, so an instant Taglish first responder has clear room to beat most agents. Viber pricing and the Facebook Lead Ads webhook path are verified and usable for MVP planning. The NPC AI advisory (2024-04) applies to a lead-qualification agent, but it sets a privacy-notice duty, not a "bot must announce it is AI" rule. Company size, competitor and pricing benchmarks, PH lead-handling norms, SMS/Meta bot policy, broker licensing and the voice-vs-text and team-split questions were NOT established by this run, so the PRD should treat them as open items. The team split is a planning decision, not something this research verified.

CONFIRMED (survived 2/3 or 3/3 verification)

C1. Filipinohomes is led by founder and CEO Anthony Gerard O. Leuterio and was operating in mid-2026. This matches the assumed filipinohomes.com company (Cebu City address on the site).

- Confidence: high (vote 3-0)
- Sources: <https://filipinohomes.com/news/from-one-office-to-over-144-branches-filipinohomes-celebrates-ceo-and-founder-anthony-leuterios-birthday>
- Evidence and caveats: The Bacolod office article (published 2026-07-06) names him founder and CEO, and the site footer is (c) 2026. Crunchbase also lists him as Founder and CEO. Caveat: the source is the company's own news site. Founding year is inconsistent: the article says a single office in 2008, while a search summary said September 2016 (no citable URL). Identity of the beta partner should still be confirmed with the user's contact.

C2. Filipinohomes describes itself as a service company with a nationwide network of property specialists serving buyers, investors and sellers, so it is brokerage-network style rather than a pure listings portal. It also has Properties search, Agents pages, blogs, magazines and an NATCON 2026 event, so treat it as a portal/brokerage hybrid. The about page names no legal entity.

- Confidence: medium (vote 2-1)

- Sources: <https://filipinohomes.com/about-us>
- Evidence and caveats: Quote verified on the page: 'Our dedicated network of property specialists works across the country...'. Other sources (Cebu Daily News, SunStar, Crunchbase, per the verifier) tie it to the Leuterio Realty & Brokerage Group. A separate claim that it is an agent-marketplace portal where the platform monitors responsiveness was refuted 1-2, so the portal-vs-brokerage split is still contested.

C3. The about page contains no quantitative facts (listing volume, agent count, founding year, revenue model, partnerships, tech stack). Headline size numbers such as '144 branches' and '35,000 agents' appear only in self-published company news, and the claim built on them was refuted 1-2 in verification. Treat company size as unverified.

- Confidence: high (vote 3-0 (about-page claim); 1-2 refuted (size claim))
- Sources: <https://filipinohomes.com/about-us>, <https://filipinohomes.com/news/from-one-office-to-over-144-branches-filipinohomes-celebrates-ceo-and-founder-anthony-leuterios-birthday>
- Evidence and caveats: The verifier's text scan of the about page found no counts or leadership names. The size figures are self-reported and were not independently confirmed. The same news site says 144+ branches while Cebu Daily News/SunStar (per the verifier) cite 52 offices in 40 cities. That discrepancy is unresolved, and it may reflect different dates.

C4. Filipinohomes publishes a per-agent 'Inquiry Reply' time and offers a 'Sort by Fastest reply'. The first 12 agents on the live page show ~10, 16, 18, 24, 31, 48, 48 min, then ~2 hr, 2 hr, 6 hr, 10 hr, 15 hr. Even top responders are not instant, and slower agents sit lower. This is the clearest evidence of a response-time gap an AI first responder could target, and a natural beta success metric.

- Confidence: medium (vote 2-1)
- Sources: <https://filipinohomes.com/agents>
- Evidence and caveats: Verifier fetched the live page on 2026-10-06 (header '1,737 Real Estate Agents'). Weaknesses: no methodology or date for the metric, so 'self-reported' vs platform-computed is unknown, and the sample is 12 of ~1,737 agents. The site also tells buyers to contact the company if there is no reply within 24 hours. A claim characterizing the agent base as a long tail of solo agents was refuted 0-3, so do not assume agent size distribution.

C5. Viber Business Messages domestic rates for the Philippines are EUR 0.0026 per transactional/OTP message and EUR 0.0053 per promotional message. Senders not headquartered in the PH (as recorded at Viber onboarding) pay the international rate of EUR 0.0750 per message, about 14x promotional and 29x transactional. The rate card also shows a EUR 115 monthly minimum for the Philippines. For the MVP cost model, the sending entity should be PH-registered.

- Confidence: high (vote 3-0 (both claims))
- Sources: <https://www.forbusiness.viber.com/documents/business-messages.pdf>
- Evidence and caveats: Primary PDF (Last-Modified 24 Sep 2026): 'Philippines | 0.0026 | 0.0053 | 0.0750 | 115'. Footnote: domestic rates apply only to an entity headquartered in the same country as the recipient. About 44,000 transactional messages are needed to exceed the EUR 115 minimum. Reseller pages quote ~USD 0.01 per message with markup. One claim framing 115 as 'the lower of two tiers (115 and 175)' was

refuted 0-3, so rely only on the 115 figure in the PH row. This is list pricing, and Viber approval for a real-estate sender was not researched.

C6. LLM choice for Taglish must be tested empirically, not assumed. On Filipino benchmarks, SEA-specific models underperform: SEA-LION v3 70B scored 61.07% on FilBench, about 11 points below GPT-4o (72.23%) and about 6.6 below Llama 4 Maverick (67.67%). Batayan also shows significant gaps for Filipino in open and commercial LLMs, attributed partly to under-representation in pre-training data.

- Confidence: medium (vote 2-1 (FilBench claim); 3-0 (Batayan claim))
- Sources: <https://arxiv.org/pdf/2508.03523>, <https://arxiv.org/abs/2502.14911>
- Evidence and caveats: FilBench (EMNLP 2025) abstract quote verified; GPT-4o, Llama 4 Maverick and Qwen2.5 72B figures come from the verifier's reading of Section 4 (not separate claims). Batayan (ACL 2025) abstract verified. Caveats: both benchmarks test NLP tasks, not Taglish sales dialogue; the model set is GPT-4o-era, with no scores found for Gemini, Claude or GPT-5; Batayan also cites morphology as a cause. Two framings were refuted 0-3: that GPT-4o is 'best of 27 evaluated models' as stated, and that Batayan directly tests code-switched Taglish. Do not use either. OttoBot's current Llama 4 Maverick via Groq looks defensible versus SEA-tuned models, but an in-house Taglish eval against current frontier models is still needed.

C7. Lamudi bundles a Lead Management Tool, Account Manager and Performance Report into every subscription, and Silver and above get child accounts for team members. An AI qualifier therefore cannot differentiate on having a lead inbox. Any speed, Taglish and booking positioning is the research team's inference, not a Lamudi statement.

- Confidence: medium (vote 2-1)
- Sources: <https://www.lamudi.com.ph/journal/lamudi-cost-per-listing/>
- Evidence and caveats: Quote reached via search-result text because direct fetches were blocked. Lamudi marketing source with no retrievable publish date. Per-listing lead routing rests on a separate Lamudi page seen only in a snippet. Trustpilot shows Lamudi at 2/5 per the verifier. All specific Lamudi tier prices (Starter through Platinum 1000, PHP 2,499 to 29,999) were REFUTED 0-3 in verification, so no Lamudi price benchmark is confirmed.

C8. NPC Advisory No. 2024-04 (issued 19 Dec 2024) applies the Data Privacy Act 2012 and IRR across the whole AI lifecycle, so an OttoBot agent handling names, phones, budgets and OFW status is in scope. Its transparency duty requires telling data subjects the nature, purpose and extent of AI processing and being able to explain risks. It is a privacy-notice duty. The advisory contains no rule that a chatbot must announce itself as an AI.

- Confidence: medium (vote 2-1 (applicability); 3-0 (transparency, no chatbot-identity rule))
- Sources: <https://regulations.ai/regulations/RAI-PH-NA-NAN2GXX-2024>
- Evidence and caveats: Secondary aggregator, corroborated by Rajah & Tann (23 Dec 2024) and Ocampo & Suralvo (June 2026). For the transparency point the verifier read the primary NPC PDF: the words chatbot, interact, virtual assistant and conversational do not appear. Cite the NPC PDF directly and say 'issued 19 Dec 2024', since the effectivity clause was not confirmed. No amendment was found as of Oct 2026. This covers only this advisory, not other PH rules or Meta/Viber platform policies.

C9. Facebook Lead Ads can be ingested push-style: subscribe the app to the Page object's leadgen webhook field, install the app on the Page via POST /{page-id}/subscribed_apps?subscribed_fields=leadgen using a Page access token from a user with the ADVERTISE task. This is a workable lead-source path for an OttoBot ingest endpoint.

- Confidence: high (vote 3-0)
- Sources: <https://developers.facebook.com/documentation/ads-commerce/marketing-api/guides/lead-ads/quickstart/webhooks-integration>
- Evidence and caveats: Meta primary documentation, updated May 21, 2026. Omitted requirements: pages_read_engagement, pages_manage_metadata, pages_show_list, ads_management and lead_retrieval permissions. The webhook likely carries only a leadgen_id, so a follow-up Graph API GET is needed (the verifier recalled this from experience rather than from the fetched text). The app probably needs App Review and advanced access for Pages it does not manage. Whether Filipinohomes runs Lead Ads at all is unknown. No Filipinohomes webhook/API/email integration path was verified.

Caveats

Only 12 of 80 extracted claims survived verification, and several whole topics came through thin or empty. Not established: PH inquiry-to-reply norms and dominant channel mix, with Messenger dominance sourced only from a vendor blog whose claim was refuted 0-3; Pag-IBIG, pre-selling vs RFO and OFW qualification facts; PH competitor AI tools; any per-lead or per-booking PH pricing; SMS/NTC/DTI rules; Meta and WhatsApp AI-bot and outbound-template policy; Viber approval for this use case; PRC/DHSUD licensing implications; voice vs text; and Filipinohomes' tech stack and lead routing. Anything on these in the extraction list is [unverified] and sits in 'Extracted but NOT verified' (68 claims, budget cut, not refuted), for example [unverified] Pag-IBIG needs 24 contributions, [unverified] pre-selling down payments of 10-35%, [unverified] PH brokers keep leads in Viber chats and Excel, [unverified] CEO named 2024 NAR International Realtor of the Year, [unverified] a 3-5 week chatbot build quote. Do not read their absence from the confirmed list as evidence they are false or that nothing exists on them. Several pricing claims were actively refuted (Lamudi tiers, PHP 15,000-30,000 per month chatbot service, 5-minute response-time stats as unsourced), so do not put those numbers in the PRD. Source quality is mixed: Filipinohomes pages are primary but self-published; Lamudi is marketing; regulations.ai is a secondary aggregator. The Viber rate card and FilBench/Batayan are the strongest sources, but the benchmarks predate current frontier models. Dates: most verified sources are 2025-2026, and the Lamudi article is undated. Product-risk flag for the PRD: the project's rule that agents must never reveal they are AI is not itself ruled out by NPC 2024-04, but the advisory's transparency duty about AI-driven processing, plus unresearched Meta/Viber platform policies, means the privacy notice, consent capture and platform bot-disclosure rules need a decision before the beta goes live with real leads. The 50/50 backend-agent vs frontend-mobile split is a planning choice for the PRD, not something the research validated.

Open questions

- How do Filipinohomes leads reach agents today (on-platform Message button, email, Facebook Lead Ads, calls), and can the company expose a webhook, API or email-forward to feed OttoBot? This needs a direct conversation with the beta contact, since no public integration was verified.
- What are the real inquiry-to-first-reply times and lead volume across Filipinohomes' agents (the Inquiry Reply metric has no stated method), and what baseline and success target should the beta use (for

example median first reply and booked site viewings)?

- What do Meta (Messenger/WhatsApp) and Viber require for AI bots and outbound templates, what PH SMS/NTC and consent rules apply, and how should the 'never reveal AI' product rule be reconciled with them and the NPC transparency duty?
- Does an AI qualifying and booking leads for licensed agents create PRC/DHSUD broker-licensing exposure, and is OttoBot acting for the licensed broker (as a tool) or independently? No verified source was found.

REFUTED (do not use)

- [1-2] Filipinohomes is a nationwide agent-network brokerage (not just a listings portal) with over 144 branches and about 35,000 agents, started from a single office in 2008. This is self-reported on the company's own news site and is not independently verified.
- [1-2] Filipinohomes is an agent-marketplace portal: agents post and maintain their own listings, and the platform tracks and monitors agent responsiveness. Supports a portal-to-agent lead model, not a central brokerage.
- [0-3] Lamudi PH subscription pricing is tiered by listing quota: Starter 15 = PHP 2,499/mo for 15 listings; Basic = PHP 2,999/mo for 20; Bronze = PHP 4,299/mo for 40; Silver = PHP 7,999/mo for 80 (implied roughly PHP 100-170 per listing slot per month at the low tiers).
- [0-3] On FilBench (Filipino, Tagalog, Cebuano), the best of 27 evaluated LLMs, GPT-4o, scored only 72.23%. Even frontier models are far from solved on Filipino, so an MVP should expect imperfect Tagalog/Taglish quality and plan for guardrails and human handoff.
- [0-3] Top Lamudi tiers aimed at developers and large brokerages are PHP 14,999/mo (Platinum, 300 listings), PHP 19,999/mo (Platinum 500) and PHP 29,999/mo (Platinum 1000, 1000 listings, 14 child accounts), i.e. under PHP 30/listing/mo at the top tier. This is a pricing ceiling for portal-side tooling that an add-on lead-qualification product would sit beside.
- [0-3] The agents directory lists about 1,731 agents (page title says 1,731; the task prompt said 1,737, so the count changes over time). Many are small, individual agents with few listings (for example 7, 11, 12, 17, 24, 52 and 165 listings), spread across Cebu, Naga, Bacolod, Lapu-Lapu and General Santos. The customer base is a long tail of solo agents, not a few large developers.
- [0-3] The Philippines row carries a EUR 115 monthly minimum commitment fee, the lower of the two tiers on the card (115 and 175). This is a fixed cost for a pilot, and it applies per the rate card regardless of volume.
- [0-3] Batayan is a Filipino benchmark covering eight tasks across understanding, reasoning, and generation, including both Tagalog and code-switched Taglish utterances, so it directly tests the language mix OttoBot targets.
- [0-3] Its target customers are three segments: first-time home buyers, investors and sellers. This matches OttoBot's buyer/seller lead-qualification use case.
- [0-3] OFWs can complete a Philippine condo purchase remotely via a Special Power of Attorney, a representative, online reservations and video-call viewings, so the buyer is often unreachable in person and the agent's only channel is remote chat or call. This supports a chat-first bot with OFW-aware qualification.
- [0-3] Vendor-quoted pricing benchmark: small PH brokerages pay roughly PHP 15,000-30,000 per month for a real estate AI chatbot service (done-for-you agency pricing, not per-lead or per-booking).

- [0-3] Financing path is a key qualification variable. Pag-IBIG requires at least 24 monthly contributions and has a 5.75%-9.75% rate range; bank loans run 6%-10% for up to 20 years at 80-90% loan-to-value. Both figures come from one broker blog and should be checked against Pag-IBIG and bank primary sources.
- [0-3] The source asserts that Facebook Messenger is the dominant business channel in the Philippines and that most buyers start from Facebook ads and message directly from the ad. It also requires Taglish support. The Messenger claim is backed only by a link to Meta developer docs, which do not show PH market share.

UNVERIFIED (leads only)

- The CEO was named 2024 International Realtor of the Year by the National Association of Realtors (US). This is a claim from the company's own site and was not checked against NAR. (source: <https://filipinohomes.com/news/from-one-office-to-over-144-branches-filipinohomes-celebrates-ceo-and-founder-anthony-leuterios-birthday>)
- The network is organized into teams (for example Team Red Diamond and Team VIP) with team leaders and unit managers. Branch offices run new-agent orientations on prospecting and digital marketing, plus product-knowledge seminars on developer projects. Many agents are inexperienced recruits who prospect and market leads themselves. This points to a decentralized, agent-driven lead-handling model where a lead-response bot could help. (source: <https://filipinohomes.com/news/from-one-office-to-over-144-branches-filipinohomes-celebrates-ceo-and-founder-anthony-leuterios-birthday>)
- The company stresses personalized, long-term client support and 'innovation', which suggests openness to tooling but also a service-quality brand that an AI agent must not undermine. It does not mention any existing AI or chatbot tooling. (source: <https://filipinohomes.com/about-us>)
- The article gives no information about lead response times, technology stack, integrations, listing volume, revenue model, or how portal leads are routed to agents. Those questions need other sources. The page is a PR-style news item published on Filipinohomes' own site (updated Jul 6, 2026), and the fetched text was truncated after the Bacolod section. (source: <https://filipinohomes.com/news/from-one-office-to-over-144-branches-filipinohomes-celebrates-ceo-and-founder-anthony-leuterios-birthday>)
- The site's media is hosted on an AWS S3 bucket in the ap-southeast-1 (Singapore) region, which is a weak signal of an AWS-based stack. This is an inference from an asset URL only, not a stated fact. (source: <https://filipinohomes.com/about-us>)
- Pag-IBIG eligibility for OFWs requires at least 24 monthly contributions (not necessarily consecutive), active membership, and age not above 65 at loan maturity. This is a core qualification gate an OFW-facing lead-qualification bot should ask about. (source: <https://homeward.ph/guides/pag-ibig-housing-loan/>)
- Pre-selling Philippine condos typically carry a 10-35% down payment split into interest-free monthly installments over the 2-4 year construction period, with the remaining 65-90% settled at turnover via bank loan, Pag-IBIG loan, or developer in-house financing. This is the core qualification structure (pre-selling vs RFO, financing route) an agent must capture. (source: <https://manilaskylinecondos.com/post/pre-selling-vs-rfo-condo-philippines>)
- RFO purchases require a faster, smaller-window cash commitment: a 10-20% down payment within 30-60 days of reservation, then bank or Pag-IBIG financing. Buyers are advised to pre-screen financing eligibility before reserving, which makes financing-route and pre-qualification questions key lead-qualification fields. (source: <https://manilaskylinecondos.com/post/pre-selling-vs-rfo-condo-philippines>)
- PH brokers commonly keep client data in Excel sheets, notebooks and scattered Viber chats. Viber is therefore a de facto working channel for PH agents. The page offers no data on prevalence, so this is an

- assertion rather than a measurement. (source: <https://irealtee.com/features/client-management>)
- PH real-estate lead pipeline stages include 'Tripping Scheduled' (site visit) and 'Reserved' (reservation fee paid). Lead sources include Facebook ads, referrals and 'tripping events'. This suggests a booking agent's target action is a scheduled site visit ('tripping'), and that qualification should capture budget, preferences, financing and timeline. (source: <https://irealtee.com/features/client-management>)
 - The article asserts WhatsApp is the primary communication app for over 90% of Philippine smartphone users, citing Statista 2023. This is checkable and likely false or misattributed, because Facebook Messenger and Viber are widely reported as dominant PH channels. It should not drive channel choice for OttoBot's MVP. (source: <https://bossbot.uk/blog/whatsapp-real-estate-philippines>)
 - Filipinohomes states that every listed agent is licensed and part of a nationwide network, and points buyers to the PRC site to verify RES/REB licenses. The claim is self-asserted. It bears on the PRC/DHSUD licensing implications of an AI qualifying leads, because the licensed human agent stays the party of record. (source: <https://filipinohomes.com/agents>)
 - Each agent card exposes an in-platform 'Message' button, a 'My Page' agent microsite and a profile page, so inquiries enter through on-platform messaging. Any integration would have to hook into this messaging or inquiry flow. Public integration or webhook availability is not stated on this page. (source: <https://filipinohomes.com/agents>)
 - The guide's broker publishes Viber and WhatsApp as direct contact channels for OFW buyers. This is anecdotal evidence that Viber and WhatsApp are the primary OFW inquiry channels; it does not show market share or response times. (source: <https://homeward.ph/guides/ofw-condo-buying-guide/>)
 - Pre-selling versus RFO is a core qualifier. Pre-selling is said to be 10-30% cheaper with a 2-5 year wait for turnover, and typical reservation fees are PHP 10,000-50,000. These are unsourced blog figures. (source: <https://homeward.ph/guides/ofw-condo-buying-guide/>)
 - Fake-broker scams are a recognised trust issue for OFW buyers, with PRC license verification as the main protection. A bot that qualifies leads should therefore state the broker's PRC license number and never ask for payments. (source: <https://homeward.ph/guides/ofw-condo-buying-guide/>)
 - The page lists 2026 Pag-IBIG housing loan rates by repricing period, from 5.75% (1 year) to 9.75% (30 years), with 6.25% for 3 years and 6.50% for 5 years. The rates come from a broker blog, not Pag-IBIG, and need checking against Pag-IBIG's official schedule. (source: <https://homeward.ph/guides/pag-ibig-housing-loan/>)
 - The page says Pag-IBIG processing takes 2-3 months in total, against 2-4 weeks for banks. It also says Pag-IBIG down payment is 5-10% against 20% for banks, with a maximum loan of P6,000,000. These figures affect how a bot should set expectations and route financing-type questions. (source: <https://homeward.ph/guides/pag-ibig-housing-loan/>)
 - OFW buyers need an SPA (special power of attorney) authenticated at the consulate, which can take 2-4 weeks alone. The page advises starting document prep while still shopping for properties. This supports an OFW-status qualification question and a document-readiness follow-up flow. (source: <https://homeward.ph/guides/pag-ibig-housing-loan/>)
 - Pag-IBIG eligibility requires at least 24 monthly contributions, and in-house developer financing carries a higher interest rate but lighter credit requirements than banks. These are concrete qualifying criteria for a financing-type qualification step. (source: <https://manilaskylinecondos.com/post/pre-selling-vs-rfo-condo-philippines>)
 - OFW buyers are named as a target segment for pre-selling because monthly equity payments map onto remittance schedules. This supports OFW status as a qualification question and as a distinct segment. (source: <https://manilaskylinecondos.com/post/pre-selling-vs-rfo-condo-philippines>)

- Vendor attributes a 1-2% average real-estate conversion rate to a Lamudi study, citing disorganized follow-up as a primary cause. This is secondhand and unverified; the vendor does not link the Lamudi study directly. (source: <https://irealtee.com/features/client-management>)
- Buyer profiles in PH brokerage CRMs typically hold property interest (location, unit type, price range), purchase timeline, payment capacity and source attribution. This is a reasonable baseline schema for OttoBot qualification fields. (source: <https://irealtee.com/features/client-management>)
- Vendor claims scattered client data violates National Privacy Commission requirements under the Data Privacy Act of 2012 (RA 10173), and lists OFW buyers across time zones as a distinct challenge. This is vendor marketing, not legal analysis, and needs verification against the NPC. (source: <https://irealtee.com/features/client-management>)
- Responding to a lead within 5 minutes raises lead qualification by 21x, attributed to HubSpot 2023. This figure is usually traced to the older Lead Response Management / InsideSales (MIT) study, so the attribution and date should be verified. It is not PH-specific data. (source: <https://bossbot.uk/blog/whatsapp-real-estate-philippines>)
- The article names the core qualification fields for an automated real-estate bot: budget, location and property type. It also lists after-hours replies, viewing reminders to cut no-shows, and sending location pins. These match OttoBot's planned qualify-and-book scope, but it omits PH-specific fields such as pre-selling vs RFO and Pag-IBIG/bank/in-house financing. (source: <https://bossbot.uk/blog/whatsapp-real-estate-philippines>)
- The compliance guidance is a single generic FAQ line: WhatsApp automation is legal in PH if agents follow the Data Privacy Act of 2012 (RA 10173) by obtaining consent and protecting data. It cites no NPC rules, no AI-disclosure requirement, and no Meta template policy. It is too thin to use as a compliance source. (source: <https://bossbot.uk/blog/whatsapp-real-estate-philippines>)
- Homeward is a PRC-licensed real-estate broker (No. 0025157) serving OFWs in the UAE, Saudi Arabia, Qatar, Singapore, Hong Kong, Japan and Canada. It uses Viber and WhatsApp as direct contact channels, with Viber and WhatsApp links on its guide. This is evidence that OFW-focused brokers lead with messaging apps rather than web forms. It is a single competitor/prior-art data point, not evidence about Filipinohomes. (source: <https://homeward.ph/guides/pag-ibig-housing-loan/>)
- Legal context for buyers: Maceda Law (RA 6552) gives a 50% cash surrender value after 2 years of installments (rising 5% per year after 5 years, capped at 90%), and PD 957 requires a DHSUD License to Sell before a developer can pre-sell. A sales or qualification bot must not misstate these, so license-verification and refund-rights answers need guardrails or a human handoff. The article also estimates about 25% Metro Manila condo vacancy in late 2025, a market-estimate figure the author does not source. (source: <https://manilaskylinecondos.com/post/pre-selling-vs-rfo-condo-philippines>)
- The article cites Philippine Statistics Authority (2024) as reporting 73% internet usage in the Philippines, and names OFWs as a target segment. The figure is unverified and the page links no primary PSA document. (source: <https://bossbot.uk/blog/whatsapp-real-estate-philippines>)
- The source claims AI chatbots cut viewing-booking time from 24-48 hours to within 10 minutes and qualify buyers in about 2 minutes (budget, timeline, location). It also says FAQs make up 40-60% of initial inquiries. These are unsourced vendor figures. They are plausible baselines for OttoBot's qualification flow but cannot be verified. (source: <https://botsatwork.ph/2026/02/24/ai-chatbot-for-real-estate-philippines/>)
- The page's PH chatbot vendor comparison gives only pricing models, no peso or dollar figures: Bots at Work charges a build fee plus monthly retainer, while Senti AI, Stratpoint and Proto use enterprise-contract or project-based pricing. It gives no per-lead or per-booking benchmark, so it cannot anchor OttoBot pricing. (source: <https://botsatwork.ph/2025/10/07/top-ai-chatbot-company-philippines-2026/>)

- The article names Senti AI, Stratpoint and Proto as enterprise-focused PH conversational-AI vendors, and Bots at Work (the publisher) as the SME-focused one. None is described as real-estate specific, which suggests no named PH vendor in this list dominates SME or portal real-estate lead qualification. (source: <https://botsatwork.ph/2025/10/07/top-ai-chatbot-company-philippines-2026/>)
- The post asserts that leads contacted within 5 minutes are 100 times more likely to convert than leads contacted after 30 minutes. It names no source ("Research on customer behavior shows"). This is a widely recycled, weakly sourced sales-statistic and should be treated as unverifiable. (source: <https://botsatwork.ph/2026/02/23/ai-lead-capture-philippines/>)
- The post uses an illustrative model with no cited data: a real-estate office missing 10 leads a month at a ₱100,000 average sale loses ₱12 million a year. It also says an extra sales/support hire costs ₱25,000-₱40,000 a month, and that an AI chatbot costs a fraction of that. The ₱12M figure assumes every missed lead would have closed and is internally inconsistent with a ₱100k average sale. The ₱25-40k salary range is a usable pricing anchor but is uncited. The post does not give actual chatbot prices. (source: <https://botsatwork.ph/2026/02/23/ai-lead-capture-philippines/>)
- Lamudi's described feature set (filters, loan calculator, saved alerts, live chat/email support) lists no AI lead-qualification or chatbot capability. Its own support is said to take about a day to respond, and the review gives no data on agent inquiry response times. This suggests an unfilled gap but is only weak, absence-based evidence. (source: <https://homesandland.ph/lamudi-review-for-the-philippines-2025/>)
- Lamudi's pay-per-feature add-on pricing for non-subscribers is PHP 599 (7-day), PHP 849 (14-day) and PHP 1,199 (30-day) per featured listing; subscribers on Basic to Platinum 1000 pay PHP 350 / 500 / 700. This is a benchmark for per-listing visibility spend, not per-lead pricing. (source: <https://www.lamudi.com.ph/journal/lamudi-cost-per-listing/>)
- The source says a production-ready PH real estate chatbot takes 3-5 weeks to build (property database + conversation design in week 1, bot build and CRM/calendar integration in weeks 2-3, testing week 4, launch week 5). This is a vendor's estimate for custom builds. (source: <https://botsatwork.ph/2026/02/24/ai-chatbot-for-real-estate-philippines/>)
- The source is a marketing page from Bots at Work, a done-for-you chatbot agency founded by Dominic Barrios. It lists clients that are mostly automotive and utility brands (AC Motors, KTM, Kia, Volkswagen, Honda Philippines, Aboitiz Power) and no real estate developers. It cites n8n, HubSpot, Salesforce and Google Sheets as integration options. It says nothing on the Data Privacy Act, AI disclosure, Meta template rules or Viber. (source: <https://botsatwork.ph/2026/02/24/ai-chatbot-for-real-estate-philippines/>)
- The site's real-estate chatbot page says PH real-estate buyers switch between English and Taglish, and that Facebook Messenger remains the dominant business-communication channel. It treats Taglish support and Messenger-native bots, not just web widgets, as baseline requirements. The claim is asserted without a cited survey. This text comes from a linked page the fetch also indexed (the botsatwork.ph real-estate chatbot page), not the 2026 guide itself. (source: <https://botsatwork.ph/2025/10/07/top-ai-chatbot-company-philippines-2026/>)
- The vendor's lead-capture page gives a speed-to-lead cost model: a PH real-estate office missing 10 leads per month at a P100,000 average sale loses P12 million a year. It also says a staff hire costs P25,000-P40,000 per month, which can serve as a rough price ceiling for an AI qualifier. These are illustrative vendor figures, not measured data, and the '100x within five minutes' stat is an unsourced generic claim. They come from a linked page indexed alongside the guide, not the guide itself. (source: <https://botsatwork.ph/2025/10/07/top-ai-chatbot-company-philippines-2026/>)
- The post cites DataReportal's 2024 Philippines study to claim 71% of Filipino SMEs use social media for customer engagement but lack structured systems to respond at scale. This is a vendor blog restating a

stat. The figure is unverified here and dated 2024, so it is about 2 years old. (source:

<https://botsatwork.ph/2026/02/23/ai-lead-capture-philippines/>)

- The post says Filipino consumers now expect replies within the first hour. It gives no source or data, so this is an unsupported assertion. (source: <https://botsatwork.ph/2026/02/23/ai-lead-capture-philippines/>)
- The post's recommended feature set for a PH lead-capture bot: run on Messenger, WhatsApp and website chat; ask conversational qualifying questions without long forms; integrate with the existing CRM; and hand off to salespeople without losing context. It positions the bot as a qualifier that supports human closers, not a replacement. The post does not mention Taglish/Tagalog handling, Viber, the Data Privacy Act or AI disclosure. (source: <https://botsatwork.ph/2026/02/23/ai-lead-capture-philippines/>)
- Lamudi PH agent/seller subscription pricing is reportedly Basic free, Pro PHP 999/month for 10 listings, and Business custom (agency-scale). This is a pricing benchmark for portal listing fees, not for lead-qualification software, and no official Lamudi source is cited for it. (source: <https://homesandland.ph/lamudi-review-for-the-philippines-2025/>)
- Lamudi is free for buyers and renters. Revenue comes from seller/agent subscriptions, so the portal is a listing marketplace and not a per-lead or per-booking vendor. (source: <https://homesandland.ph/lamudi-review-for-the-philippines-2025/>)
- The article names the pre-inquiry buyer journey as non-linear and trust-driven (compare, leave, return, ask around). This loosely supports the need for follow-through after a form fill, but it is an unquantified opinion. (source: <https://www.truelogic.com.ph/blog/real-estate-strategies/>)
- The Megaworld and Ayala Land sections cover only website presentation and brand storytelling. They say nothing about AI lead qualification, chatbots, CRM, or lead-handling tooling, so this page is not evidence of prior art for AI lead qualification at these developers. (source: <https://www.truelogic.com.ph/blog/real-estate-strategies/>)
- The article publishes no per-lead or per-booking pricing and says nothing about response times or AI/chatbot features. It only covers per-listing subscription pricing, so it cannot answer per-lead pricing benchmarks. Its text is also internally stale: it references 1Q2023 and 'Starter 5 and Starter 10' packages that are not listed, even though the page is dated 2021. (source: <https://www.lamudi.com.ph/journal/lamudi-cost-per-listing/>)
- The vendor says one multi-channel bot can cover Messenger, WhatsApp, Viber, Instagram, web chat, TikTok DMs and SMS at once. Its comparison table lists only Messenger, WhatsApp and website chat for its own product, so the Viber and SMS coverage is unproven. It says nothing about Viber Business cost or Meta template or AI-bot policy constraints. This text comes from a linked page indexed alongside the guide, not the guide itself. (source: <https://botsatwork.ph/2025/10/07/top-ai-chatbot-company-philippines-2026/>)
- Buyer inquiries on Lamudi go to individual licensed brokers or developers, and the reviewer anecdotally got same-day agent replies. This is a single-user anecdote, not measured response-time data. (source: <https://homesandland.ph/lamudi-review-for-the-philippines-2025/>)
- Lamudi is operating alongside Dot Property Group, which co-hosted the CONNECT Manila 2025 industry event. The article cites this only in its references list, with a BusinessWorld link dated Oct 2025. The relationship is worth verifying for competitor mapping. (source: <https://homesandland.ph/lamudi-review-for-the-philippines-2025/>)
- The article describes Lamudi Philippines as a search-led discovery portal where users browse by city, budget, property type, or development stage, with inquiry paths as the conversion step. It gives no lead volume, response-time, or chatbot data. (source: <https://www.truelogic.com.ph/blog/real-estate-strategies/>)
- The article treats contact friction as a driver of lost attention. It makes a general claim that hard-to-contact brands lose attention fast, with no data on PH response times or messaging channels (Messenger, Viber,

WhatsApp). (source: <https://www.truelogic.com.ph/blog/real-estate-strategies/>)

- The advisory requires meaningful human intervention by authorized personnel, and requires explicit consent plus human oversight for automated decisions with legal or significant effects. For an MVP, lead qualification and booking is likely low-stakes, but any automated lead rejection or scoring that routes people away from properties needs a human override and an escalation path. (source: <https://regulations.ai/regulations/RAI-PH-NA-NAN2GXX-2024>)
- Domestic rates apply only if the sending business entity is headquartered in the same country as the recipient, as recorded on Rakuten Viber at onboarding. A non-Philippine entity (or one onboarded elsewhere) would pay international rates for PH recipients, so entity registration location matters for cost. (source: <https://www.forbusiness.viber.com/documents/business-messages.pdf>)
- The card covers one-way business messages (transactional/OTP and promotional) and refers to Viber Chatbots on a separate page. It gives no pricing for two-way conversational or session messages, so the cost of an inbound or reply bot flow is not answered by this document. It has no stated publication date and prices are in euros. (source: <https://www.forbusiness.viber.com/documents/business-messages.pdf>)
- Data subjects must be able to object, rectify and erase their data even after it has entered AI datasets. Privacy Impact Assessments are required for AI systems with significant risks, and PICs must keep documentation and audit trails of AI processing. OttoBot therefore needs a delete/opt-out mechanism, conversation-log retention rules, and a written PIA or processing record before the Filipinohomes pilot. (source: <https://regulations.ai/regulations/RAI-PH-NA-NAN2GXX-2024>)
- The page asserts an enforcement timeline (grace period to March 2025, NPC audits of high-risk AI from July 2025) and administrative fines of PHP 500,000 to 5,000,000. These details come from the aggregator's AI-written summary, not the advisory text, and should be checked against the primary PDF at privacy.gov.ph before use. The DPA's penalty regime is mainly criminal (imprisonment and fines), so the fine range is suspect. The page also borrows EU AI Act risk tiers that the advisory itself may not use. (source: <https://regulations.ai/regulations/RAI-PH-NA-NAN2GXX-2024>)
- The leadgen webhook notification carries only identifiers (leadgen_id, page_id, form_id, adgroup_id, ad_id, created_time), not the lead's contact answers. The app must make a second Graph API call using leadgen_id (per the separate Lead Ads Retrieval guide) to fetch name, phone and other form fields before OttoBot can reach out. (source: <https://developers.facebook.com/documentation/ads-commerce/marketing-api/guides/lead-ads/quickstart/webhooks-integration>)
- Reading comprehension and translation are the weak spots for several LLMs on Filipino. These matter for an inbound/outbound agent that must understand free-form buyer messages and reply in Tagalog/Taglish. (source: <https://arxiv.org/pdf/2508.03523>)
- FilBench covers four categories (Cultural Knowledge, Classical NLP, Reading Comprehension, Generation) and 12 subtasks across Filipino, Tagalog and Cebuano. It is a benchmark of academic NLP tasks, not conversational Taglish sales dialogue or real-estate lead qualification, so its scores are only a proxy for OttoBot's use case. Cebuano coverage is relevant to the Bisaya segment. (source: <https://arxiv.org/pdf/2508.03523>)
- The authors identify Filipino's rich morphology and syntactic construction as a specific modeling hurdle, and say explicit Filipino language support matters. This favors models with documented Filipino support or Filipino fine-tuning over generic multilingual models. (source: <https://arxiv.org/abs/2502.14911>)
- Batayan was built with native-speaker adaptation and validation to avoid translationese bias, which the authors say is common in existing Filipino corpora. Benchmarks that machine-translate English data may therefore overstate real Filipino conversational quality. (source: <https://arxiv.org/abs/2502.14911>)
- The authors release a public evaluation suite. The OttoBot team could reuse it to compare candidate LLMs (for example Llama 4 Maverick on Groq versus Gemini, GPT or Claude) on Filipino before committing to

one for the MVP. (source: <https://arxiv.org/abs/2502.14911>)

- The integration needs five Meta permissions (leads_retrieval, pages_manage_metadata, pages_show_list, pages_read_engagement, ads_management), plus Facebook Login and a Page access token from the client or advertiser. Filipinohomes (or each developer or agent page) would therefore have to grant OttoBot's Meta app access, which implies Meta App Review for those permissions. The page does not state App Review requirements, so that part needs separate verification. The page also lists the permission inconsistently, as lead_retrieval in the prerequisites and leads_retrieval in the requirements section. (source: <https://developers.facebook.com/documentation/ads-commerce/marketing-api/guides/lead-ads/quickstart/webhooks-integration>)
- Webhook notifications are only delivered if the Page has installed the webhook-configured app and has not disabled the App platform in its settings. A silent failure mode (no leads arriving) therefore exists per Page and needs a monitoring or fallback plan such as polling or email-parse. (source: <https://developers.facebook.com/documentation/ads-commerce/marketing-api/guides/lead-ads/quickstart/webhooks-integration>)
- The paper is a peer-reviewed-venue (EMNLP 2025) primary study with open code and a public leaderboard. Teams can re-check or extend the model comparison, for example by adding Llama 3.3 70B or Llama 4 via Groq, and run their own Taglish eval. I could not retrieve the per-model table, so Llama-family scores are unverified here. (source: <https://arxiv.org/pdf/2508.03523>)
